**10.15.1.9: Question** In a hurdle race, a player has to cross 10 hurdles. The probability that he will clear each hurdle is  $\frac{5}{6}$ . What is the probability that he will knock down fewer than 2 hurdles?

**Solution:**

$$X \sim \text{Bin}(n, p), \quad (1)$$

| Parameter | Value | Description   |
|-----------|-------|---|
| $n$       | 10    | p is the probability of a person knocking down a hurdle |
| $p$       | 5 / 6 | number of hurdles                                       |

TABLE 0  
PARAMETERS

Let  $i$  be the number of hurdles he knocks down.

$$\therefore \Pr(X = i) = {}^nC_i p^i (1 - p)^{n-i} \quad (2)$$

$$(3)$$

Let Cumulative Distribution function be:

$$F_X(i) = \Pr(X \leq i) \quad (4)$$

$$\Pr(X = i) = {}^{10}C_i p^i (1 - p)^{10-i} \quad (5)$$

$$\therefore F_X(i) = \sum_{r=0}^i {}^{10}C_r p^r (1 - p)^{10-r} \quad (6)$$

$$\therefore F_X(1) = \Pr(X \leq 1) \quad (7)$$

$$= \sum_{i=0}^1 \Pr(X = i) \quad (8)$$

$$= \sum_{i=0}^1 {}^{10}C_i \left(\frac{1}{6}\right)^i \left(\frac{5}{6}\right)^{10-i} \quad (9)$$

$$= \left(\frac{5}{6}\right)^{10} + (10) \left(\frac{1}{6}\right) \left(\frac{5}{6}\right)^9 \quad (10)$$

$$= \frac{(5)^{10}}{2 * (6)^9} \quad (11)$$

$\therefore$  The required probability is

$$\frac{(5)^{10}}{2 * (6)^9}$$
